

My Garage — Product Requirements Document

1. Feature requirements

Each feature below follows the same shape: a summary, the user story it serves, functional requirements, acceptance criteria written as Given/When/Then, edge cases, priority, success metrics, and dependencies or open questions.

1. Empty Saved (First-Time Experience)

For first-time users, the Saved page introduces the different ways they can keep track of vehicles and searches. Instead of displaying an empty list, the page explains what can be saved and provides clear entry points to start building their collection.

User story

As a first-time user, I want to understand what I can save and how to get started, so that I know where my vehicles, saved listings, saved searches, and valuations will appear.

Functional requirements

When the user has no saved content, display an onboarding empty state consisting of four informational cards.

1. My Garage

- Title: Add vehicle to your garage
- Description: Track the value of your vehicles.

2. Listings

- Title: Listings
- Description: Monitor specific vehicle listings.

3. Searches

- Title: Searches
- Description: Automate your hunt for the perfect vehicles.

4. Valuations

- Title: Valuations
- Description: Get a free market valuation.

Each card visually represents the corresponding Saved category and helps users understand what content will appear there once they begin using the product.

Display a persistent "+" (Add) action within the Saved page that provides quick access to common actions.

The Add menu includes:

- Add vehicle → launches the Add Vehicle (My Garage) flow.
- Add valuation → launches the Value vehicle flow.
- Search vehicles → navigate to the Search page, where users can browse vehicles and save searches.

Acceptance criteria

- Given a first-time user with no saved items, when they open the Saved page, then they see the four informational cards instead of an empty list.
- Given the user taps Add vehicle, then the Add Vehicle flow is launched.
- Given the user taps Add valuation, then the Value My Car flow is launched.
- Given the user taps Search vehicles, then they are taken to the Search page.

- Once the user creates their first item in any category, the corresponding informational card is replaced with real content for that section.

Edge cases & error states

- If the user has content in one or more Saved categories, only the empty categories continue to display their informational cards.
- If all four categories contain content, the onboarding cards are no longer shown.

Priority: MVP

Success metrics:

- **First Saved page** → **first saved item conversion**
- **Add Vehicle initiation rate**
- **Valuation initiation rate**
- **Search page entry rate from Saved**
- **Time to first saved item**

Dependencies / open questions:

- Add Vehicle flow
- Value vehicle flow
- Search experience
- Saved page navigation and Add (+) menu behavior

2. Add to My Garage (Owned)

Creating an owned vehicle is a guided setup that builds a complete ownership profile. The flow adapts by region to reduce manual input while collecting the information needed for accurate valuation, ownership management, and future selling.

User story

As a car owner, I want to add my vehicle to My Garage through a guided setup, so I can build a complete ownership profile that improves valuations and prepares my car for future maintenance or sale.

Functional requirements

Step 1 — Vehicle information

The entry flow differs by region.

UK

1. User enters their vehicle registration number.
2. Vehicle details are automatically populated where available, including: Make, Model, Generation, Variant, Body type, Exterior colour Year of manufacture, Engine capacity (cc), Odometer reading, Fuel type, Transmission type, Steering position

Non-UK

1. User search their vehicle by search the make and model
2. User manually enters or selects: Vehicle registration number, Generation, Variant, Body type, Year of manufacture, Engine capacity (cc), Exterior colour, Odometer reading, Fuel type, Transmission type, and Steering position

Step 2 — Purchase information

Collect ownership details:

- Purchase year
- Purchase price
- Purchased from: Dealer, Private seller, Auction, Importer or Other

Step 3 — Vehicle condition

User selects one condition:

- **Concours** : One of the very best examples of its kind in the world.
- **Excellent** : Like new inside and out, or very close to it.
- **Good**: Looks good from a distance but shows age and minor flaws up close.
- **Fair** : Obvious flaws and wear are visible even from a distance.

Step 4 — Vehicle history

Allow users to upload ownership documentation, including:

- **Service records**
- **MOT certificates (where applicable)**
- **Ownership papers**
- **Maintenance invoices**

The system extracts information from uploaded documents and generates a chronological vehicle history timeline that can later strengthen valuation confidence and help future buyers understand the vehicle's history.

Step 5 — Photos & videos

Allow users to upload:

- **Vehicle photos and videos (optional)**
- **Walkaround photos and videos (optional)**
- **Interior photos**
- **Exterior photos**

These assets become part of the vehicle profile and can later be reused for valuation updates or marketplace listings.

Acceptance criteria

- Given a UK user, when they enter a valid registration number, then supported vehicle information is automatically populated before the user continues.
- Given a non-UK user, when adding a vehicle, then all vehicle details are entered manually.
- Given the setup flow, users cannot finish until all required fields for each step are completed.
- Given uploaded documents, they are attached to the vehicle profile and included in the generated vehicle history timeline.
- Given uploaded photos and videos, they are stored within the vehicle profile for future valuation and listing use.
- After completing the final step, the vehicle appears in My Garage.

Edge cases & error states

- Registration lookup fails (UK): Allow the user to continue with manual vehicle entry.
- Registration not found : Show "Vehicle not found" and offer manual entry.
- Document upload fails: Retry without losing previously uploaded files.

- User exits during onboarding : Save progress as a draft so setup can be resumed later.
- Network interruption : Preserve entered information and resume once the connection is restored.

Priority: MVP

Success metrics: Valuation → Save conversion; Time from Save to first added detail (photo/doc/mileage)

Dependencies / open questions: Account/auth flow Content model (Feature: Vehicle object)

3. My Vehicle Details

The My Vehicle Details page is the primary management hub for an owned vehicle. It combines ownership information, valuation insights, market intelligence, reminders, and service history into a single view, allowing owners to understand their vehicle's current value, maintain important records, and prepare for future resale.

User story

As a vehicle owner, I want a complete overview of my car in one place, so I can manage ownership, track its value, monitor the market, and keep all important information together.

Functional requirements

The vehicle detail page consists of the following sections.

1. Vehicle summary

Display the primary vehicle information, including:

- Vehicle photo
- Make and model
- Year of manufacture
- Current mileage

2. Ownership reminders

Display key ownership dates. Supported reminder types include:

- MOT expiry
- Insurance expiry
- Vehicle tax expiry
- Service due

Each reminder shows:

- Status
- Due date
- Visual urgency when approaching expiry

3. Vehicle valuation

Display the latest estimated market valuation, including:

- Current estimated value
- Last updated date
- Confidence that the valuation is based on the latest available market data
- Provide primary actions: Sell my car and Get expert valuation

The valuation should always represent the latest available estimate for the vehicle.

4. Market insights

Provide live market intelligence for similar vehicles. Display:

- Average market price
- Historical market price trend
- Highest recorded sale price
- Lowest recorded sale price

- Number of vehicles sold
- Number of users saving similar listings
- Number of active listings currently on the market

Allow users to:

- Toggle between aggregated trends and individual sales.
- Provide additional market indicators, including:
 - Month-over-month price movement
 - Month-over-month sales movement
 - Recent market demand

The market dataset should be generated from comparable vehicles over a configurable time period (e.g. previous 30 days).

5. Comparable vehicles

Display examples of similar vehicles currently for sale or recently sold. Each comparable includes:

- Vehicle title
- Price
- Source (auction, marketplace, dealer, etc.)
- Listing count
- Market trend indicator

6. Purchase details

Store ownership acquisition information. Fields include:

- Purchase price
- Purchase date/year
- Purchase source

Users can edit these details at any time.

7. Vehicle information

Display the core specifications collected during onboarding. Including:

- Steering position
- Odometer reading
- Transmission
- Engine capacity
- Year of manufacture
- Fuel type
- Exterior colour
- Acquisition source (if applicable)

Users can edit all fields.

8. Insurance

Display insurance information or available insurance offers. Supported information includes:

- Current insurer (if connected)
- Renewal status
- Starting premium
- CTA to request an insurance quote

9. MOT

Display MOT information. Including:

- Current status
- Expiry date
- Last test date
- Mileage at last MOT

- Edit details

If MOT information is unavailable, users can enter it manually.

10. Service history

Display the complete chronological ownership history. The timeline combines:

- Uploaded service records
- MOT history
- Maintenance invoices
- Ownership transfers
- Repairs
- Bodywork
- Restoration work
- Other maintenance events

Each timeline entry contains:

- Event date
- Event category
- Description
- Supporting document or image (optional)

Users can:

- View the complete history
- Add new service records
- Upload supporting documents
- Uploaded documents are processed to automatically extract relevant information where possible.

11. Page layout & scrolling behavior

The Vehicle Details page uses persistent navigation and actions to maintain context and provide quick access to the primary conversion flow.

- Sticky header

The page header remains fixed while scrolling.

- Initially, the vehicle hero displays the vehicle image, title, and summary information.
- As the user scrolls and the vehicle title moves out of view, the title transitions into the navigation bar.
- Scrolling back to the top restores the original hero header and removes the title from the navigation bar.

This behavior preserves page context without interrupting the browsing experience.

- Sticky bottom action

A fixed bottom action bar remains visible throughout the page.

Content:

- Supporting text: Ready to sell your car?
- Primary CTA: Sell my car

The bottom action is always accessible while scrolling, allowing users to initiate the selling journey from anywhere on the page.

Acceptance criteria

- Every owned vehicle has a dedicated Vehicle Details page.
- Users can edit purchase details, vehicle information, and ownership records independently.
- Market insights update using the latest available comparable vehicle data.
- The latest valuation is prominently displayed.

- Reminder cards display upcoming ownership events.
- Service history is presented chronologically.
- Users can continuously add new history records without overwriting previous entries.
- Given the user scrolls through the Vehicle Details page, the header remains fixed and the vehicle title transitions into the navigation bar once the hero title scrolls out of view.
- Given the user is viewing Vehicle Details, the sticky bottom action remains visible throughout the page and tapping Sell my car launches the selling flow for the current vehicle.

Edge cases & error states

- No valuation available → prompt the user to generate their first valuation.
- No market comparables → display available market information with an explanatory message.
- No service history → encourage users to upload documents or add their first service record.
- Missing insurance or MOT information → show an empty state with an action to add the missing information.
- Offline or API failure → display the most recently cached valuation and market data where available.

Priority: MVP

Success metrics:

- Vehicle profile completion rate
- Service history upload rate
- Valuation refresh rate
- Sell My Car CTA conversion
- Insurance quote conversion
- Average monthly return visits per vehicle
- Reminder interaction rate

Dependencies / open questions:

- Valuation engine
- Market insights service
- Vehicle document OCR
- Insurance integration
- MOT API (UK)
- Reminder and notification service
- Media storage
- Vehicle history timeline generation

4. Listing (Bookmarked Cars)

The Listing sub-tab under Saved is the direct evolution of today's save/bookmark action — cars a user wants but doesn't own, saved from a search results list or a listing page, with optional value tracking and a price alarm layered on top.

User story

As someone shopping for a classic, I want to bookmark a car I like and optionally be alerted if its price drops or interest spikes, so that I can act at the right moment without checking manually.

Functional requirements

- Bookmarking a listing (from search results or a listing page) adds it to Listing — this is the same one-tap save action users already know, no valuation step required.

- Each bookmarked car can optionally show a value chart, a price alarm (target price or % move), and a demand signal (e.g. “X buyers looking”) where data supports it.
- One-tap “Move to Owned” once the user acquires the car, converting the record into My Garage rather than creating a duplicate.
- Price alarm is opt-in per bookmark, editable later, and feeds Feature 16 notifications.

Acceptance criteria

- Given a search results list or listing page, when the user taps the bookmark/save action, then that car appears under Saved → Listing, not under My Garage.
- Given a bookmarked car with a price alarm set, when the tracked value crosses the threshold, then a notification fires.
- Given a bookmarked car the user has now bought, when they tap Move to Owned, then it moves into My Garage and is removed from Listing, carrying over any chart history/alarm rather than losing it.

Edge cases & error states

- A bookmarked car is delisted/sold to someone else — showing a clear “no longer listed” state rather than a stale “active” signal.
- Same car bookmarked from two different listings (e.g. relisted) — de-duplicate by vehicle/registration where possible rather than showing two Listing entries.

Priority: MVP (basic bookmark), Fast-follow (value chart, price alarm, demand signal)

Success metrics: Bookmark rate from search/listings; Listing → Owned conversion rate; Price-alarm engagement

Dependencies / open questions: Feature 5 (Saved tab — Listing sub-tab) Demand-signal data source

5. Searches

The third Saved sub-tab: search criteria a user has saved from a specific search, so they can re-run it or get alerted to new matching listings without rebuilding the filters from scratch.

User story

As a buyer researching a specific type of car, I want to save my search filters and results, so that I can come back to exactly the same search later or be told when something new matches.

Functional requirements

- Saving a search stores the full filter set (make, model, year range, price range, condition, location, etc.) plus a snapshot of when it was saved.
- Each saved search can be re-run on demand, returning current live results for those filters.
- Optional “alert me on new matches” toggle per saved search, feeding Feature 16 notifications.
- Saved searches are named automatically from their filters (e.g. “Porsche 911, 1970–1989, under £50k”) with the option to rename.

Acceptance criteria

- Given a search results page, when the user saves the search, then it appears under Saved → Searches with its filter set intact.
- Given a saved search, when the user re-runs it, then results reflect current live listings, not a stale snapshot.
- Given a saved search with alerts on, when a new listing matches its filters, then a notification fires.

Edge cases & error states

- Underlying filter options change (e.g. a category is retired) — degrade the saved search gracefully rather than erroring, and flag which filters no longer apply.

Priority: MVP — this is existing functionality being preserved under the new Saved structure, not new build.

Success metrics: Saved-search re-run rate; Alert opt-in rate per saved search; Alert → listing-view conversion

Dependencies / open questions: Feature 5 (Saved tab — Searches sub-tab) Existing search/filter infrastructure

6. Valuations

The Valuations sub-tab under Saved is a running log of every car the user has checked the valuation of, seeded automatically on every completed valuation. A car in Valuations is not necessarily owned or even wanted by the user; it is simply a record that a valuation was run.

User story

As someone researching vehicles or checking my own car's value, I want every valuation to be saved automatically so I can revisit previous results without completing the valuation again.

Functional requirements

Step 1 - Start a valuation

Users can begin a valuation in one of two ways:

1. Vehicle registration (UK)

Enter a UK vehicle registration number. Where supported, vehicle information is automatically populated, including:

- **Make**
- **Model**
- **Variant**

If the registration cannot be found, allow the user to continue with search make and model.

2. Search by make & model

Users manually select the vehicle by:

- Make
- Model

And continue to input Generation (where applicable) and Variant

Step 2 - Vehicle information

Before generating a valuation, collect the following information. Required fields:

- Year of manufacture
- Odometer reading : Miles/Kilometres
- How long have you owned the vehicle? Ownership options include: I don't own the vehicle, less than a month, less than a year, less than 5 years, more than 5 years

Step 3 — Vehicle condition

User selects one condition:

- Concours : One of the very best examples of its kind in the world.
- Excellent : Like new inside and out, or very close to it.
- Good: Looks good from a distance but shows age and minor flaws up close.
- Fair : Obvious flaws and wear are visible even from a distance.

Step 4 - Valuation result

After the required information has been completed, generate a valuation showing:

- Estimated market value

- Value range
- Last updated date
- Comparable market data

Acceptance criteria

- Given a completed valuation, the valuation is automatically added to Saved → Valuations.
- Given a UK registration is recognised, supported vehicle information is automatically populated.
- Given the registration cannot be recognised, the user can continue with manual vehicle selection.
- Given the same vehicle is valued again, the existing valuation entry is updated rather than duplicated.
- Given a vehicle also exists in My Garage or Listings, its valuation history remains visible.

Edge cases & error states

- Registration lookup unavailable → continue with manual vehicle selection.
- Vehicle variant unavailable → allow manual selection from available options.

Priority: MVP (automatic log), Fast-follow (grouping, comparison view, one-tap Save/Follow from an entry)

Success metrics:

- Valuation completion rate
- Registration lookup success rate
- Valuation History revisit rate
- Repeat valuation rate

7. Previously Owned (Ownership History)

Previously Owned is an archive within My Garage that keeps a record of vehicles the user has sold. Archived vehicles are accessed through the History action in the My Garage header, allowing users to review basic sale information without keeping the vehicle in their active garage.

User story

As a vehicle owner, I want to keep a record of cars I've sold, so I can look back at when they were sold and for how much.

Functional requirements

When an owned vehicle is marked as sold, it is removed from the active My Garage list and moved into the Previously Owned archive. Each archived vehicle displays:

- Vehicle information
- Sold date
- Sold price

Previously Owned vehicles are read-only and serve as a historical record of completed sales.

Acceptance criteria

- Given an owned vehicle is marked as sold, it appears in the Previously Owned archive.
- Given the user opens the History archive, all previously owned vehicles are listed.
- Given a previously owned vehicle, the sold date and sold price are displayed when available.

Edge cases & error states

- Sold price unknown → display Not available.

- Sold date unknown → display Not available.
- Vehicle sold outside the platform → users can manually archive the vehicle and enter the available sale information.

Priority: Fast-follow

Success metrics:

- Vehicles archived after sale
- Previously Owned page visits
- Percentage of archived vehicles with sale information

Dependencies / open questions:

- My Garage
- Sell My Car flow
- Vehicle ownership state management
